DYNA-TRAC VB PLOWS

VB Plow is an effective cleaner used to remove fugitive material which may have fallen onto the return side of the belt. This material can be the cause of damage to conveyor components including tail pulleys, pulley lagging, belting, and carry idlers. In particular, larger lumps may puncture the belt or cause damage to the belt carcass. Fitted with highly wear resistant long life blades, VB Plow cleans the bottom cover of the belt without damaging the belt surface. Belt vibration is eliminated due to constant contact from the plow blades.

Design Features

- Fitted with highly wear resistant polyurethane long life blades.
- Unique angled design removes fugitive material to both sides of the belt.
- Self-adjusting mechanism eliminates the need for calibration for the full life of the blades.
- Turn buckle enables fine tuning of the plow angle and eliminates vibration.
- Blade built in two sections, allowing easy replacement.
- Can be easily installed in almost any location. Safety chain to protect tail pulley.

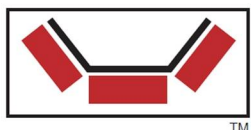

Optional Equipment

- Standard Finish - Zinc Plated, or Stainless Steel option.
